

intro ▾

JUUL | FROST ARCHITECTS is an innovative and internationally orientated practice with expertise in urban, built and landscape architecture. Space for experiences, mapping of the context and respect for future users are common elements in all our projects. We use an investigative and analytic approach to gain full understanding of the task at hand. Dialogue based planning is the instrument, that insures complete solutions and creates a common frame of reference for all involved parties.

profile ▾

JUUL | FROST ARCHITECTS is an innovative and internationally orientated practice with expertise in urban, built and landscape architecture. We span a broad professional range and are experts in developing city and transformation areas, as well as new types of buildings in urban contexts. We approach all our assignments using a dialogue based workform – no matter the scale of the project.

In professional circles we are notorious for our innovative ways of co-operating and our high architectural ambitions. We gain many of our projects through references and interviews, where the architectural solution and the process itself has the highest priority. At the heart of our work lies the development of strong, original concepts based on a close scrutiny of place, function, program and economic frame. We use an investigative, analytic approach and emphasize the concept. The company signature connotes a practice where the discussions of context, scale, time and space of the city are central elements in our work.

JUUL | FROST Architects are organized in three departments: HOUSING + BUILDINGS, CITY + SPACE and RESEARCH + COMMUNICATION.

HOUSING + BUILDINGS

Development of new housing types is the main emphasis in this department where we focus on a number of research and development assignments in housing and building practice. We continuously optimize industrialized building practices and work in the span between wood, concrete and traditional constructions to the conversion of industrial premises to housing facilities.

CITY + SPACE

Development of large masterplans is another of our core areas. Our work in this department spans from the overall city level to development of housing areas. Designmanuals and local plans are a natural result of this work. The work is developed by a interdisciplinary group of landscape architects, city planners, city builders and housing architects.

RESEARCH + COMMUNICATION

Research and presentation of central questions at urbanity and architecture are the main tasks of the department - always deeply integrated in the practices other working areas. The department presents the activities and research results of the practice and is also responsible for the internal knowledge sharing and communication.

During the past 3 years JUUL | FROST Architects have employed between 15 - 30 persons and has experienced a continuously growing turnover.
